Index  13
This library provides various concurrency utilities for use with Dylan programs.
The abstractions in this library are somewhat inspired by javax.concurrency.

1.1 Executors

Executors perform work that is requested from them asynchronously.
Currently, all executors use their own private threads.
See: <executor>, <fixed-thread-executor>, <thread-executor>, and <single-thread-executor>.

1.2 Queues

Queues are job-streams that can have items enqueued and subsequently dequeued.
These form the synchronization mechanism for thread executors.
See: <queue>, <locked-queue>.

1.3 Work

Work objects represent something to be done.
See: <work>, <locked-work>.
2.1 Executors

<executor> Abstract Class
Superclasses <object>
Init-Keywords
• name –
Operations
• executor-name
• executor-request

<thread-executor> Abstract Class
Superclasses <executor>
Init-Keywords
• queue –
Operations
• executor-shutdown

<fixed-thread-executor> Class
Superclasses <thread-executor>
Init-Keywords
• thread-count –

<single-thread-executor> Class
Superclasses <thread-executor>

executor-name Generic function
Signature executor-name (executor) => (name)
Parameters
• executor – An instance of <executor>.
Values
• name – An instance of <string>.
executor-request Generic function
Request that this executor do some work.

Signature executor-request (executor work) => ()
Parameters
• executor – An instance of <executor>.
• work – An instance of <object>.

executor-request(<function>) Method
A convenience method that converts the given function into a <work> object. The function must not have any required arguments.

Signature executor-request (executor function) => ()
Parameters
• executor – An instance of <executor>.
• work – An instance of <function>.

executor-request(<work>) Method

Signature executor-request (executor work) => ()
Parameters
• executor – An instance of <executor>.
• work – An instance of <work>.

evaluator-shutdown Generic function

Signature evaluator-shutdown (executor #key join? drain?) => ()
Parameters
• executor – An instance of <thread-executor>.
• join?(#key) – An instance of <boolean>.
• drain?(#key) – An instance of <boolean>.

2.2 Queues

<queue> Abstract Class

Superclasses <object>
Init-Keywords
• name

Discussion This is a base class for specific implementations that modify queueing behaviour.

Operations
• dequeue
• enqueue
• queue-name

<locked-queue> Class
Locked multi-reader multi-writer queue
Superclasses: <queue>

Discussion
Locked multi-reader multi-writer queue
A notification is used for synchronization. The associated lock is used for all queue state.
Locked queues can be **STOPPED** so that no further work will be accepted and processing will end once all previously submitted work has been finished.
After stopping, all further enqueue operations will signal `<queue-stopped>`.
Dequeue operations will continue until the queue has been drained, whereupon they will also be signalled.
Locked queues can be **INTERRUPTED** so that no further work will be accepted or begun. Work that has already been started will continue.
Interrupting implies stopping, so enqueue operations will be signalled `<queue-stopped>`.
Dequeue operations will signal `<queue-interrupt>`.

Operations
- `interrupt-queue`
- `stop-queue`

**dequeue** Generic function
Dequeue the next available item from the queue.

**Signature**
```plaintext
dequeue (queue) => (object)
```

**Parameters**
- `queue` – An instance of `<queue>`.

**Values**
- `object` – An instance of `<object>`.

**Discussion**
Dequeue the next available item from the queue.
May signal `<queue-interrupt>` or `<queue-stopped>` when the queue has reached the respective state.

**enqueue** Generic function
Enqueue a work item onto the queue.

**Signature**
```plaintext
enqueue (queue object) => ()
```

**Parameters**
- `queue` – An instance of `<queue>`.
- `object` – An instance of `<object>`.

**Discussion**
Enqueue a work item onto the queue.
May signal `<queue-stopped>` when the queue no longer accepts work.

**queue-name** Generic function
Returns the name of the queue.
**Signature**  queue-name (queue) => (name?)

**Parameters**

- **queue** – An instance of `<queue>`.

**Values**

- **name?** – An instance of `false-or(<string>)`.

**interrupt-queue**  Generic function
Interrupts the queue, abandoning submitted work.

**Signature**  interrupt-queue (queue) => ()

**Parameters**

- **queue** – An instance of `<locked-queue>`.

**Discussion**
Interrupts the queue, abandoning submitted work.

Submitters will be signalled `<queue-stopped>` in `enqueue` if they try to submit further work.

Receivers will be signalled `<queue-interrupt>` at the first `dequeue` operation they perform.

**stop-queue**  Generic function
Stops the queue so that submitted work can still continue.

**Signature**  stop-queue (queue) => ()

**Parameters**

- **queue** – An instance of `<locked-queue>`.

**Discussion**
Stops the queue so that submitted work can still continue.

Submitters will be signalled `<queue-stopped>` in `enqueue` if they try to submit further work.

Receivers will be signalled `<queue-stopped>` in `dequeue` once the queue has been drained.

**<queue-condition>**  Abstract Class
Conditions related to `<locked-queue>` operations.

**Superclasses**  `<condition>`

**Init-Keywords**

- **queue** –
- **thread** –

**<queue-interrupt>**  Class
Signalled when the queue has been interrupted.

**Superclasses**  `<queue-condition>`

**<queue-stopped>**  Class
Signalled when the queue has been stopped.

**Superclasses**  `<queue-condition>`
queue-condition-queue Generic function

Signature queue-condition-queue (condition) => (queue)
Parameters
  • condition – An instance of <queue-condition>.
Values
  • queue – An instance of <queue>.

queue-condition-thread Generic function

Signature queue-condition-thread (condition) => (thread)
Parameters
  • condition – An instance of <queue-condition>.
Values
  • thread – An instance of <thread>.

2.3 Work

<work> Class

Superclasses <object>
Init-Keywords
  • function – A function to perform some work. The function must not have any required arguments.

Operations
  • work-finished?
  • work-perform
  • work-started?
  • work-thread

<locked-work> Class

Superclasses <work>
Operations
  • work-wait

work-finished? Generic function

Signature work-finished? (work) => (finished?)
Parameters
  • work – An instance of <work>.
Values
  • finished? – An instance of <boolean>.
work-perform Generic function

Signature  work-perform (work) => ()

Parameters

• work – An instance of <work>.

work-started? Generic function

Signature  work-started? (work) => (started?)

Parameters

• work – An instance of <work>.

Values

• started? – An instance of <boolean>.

work-thread Generic function

Return the thread on which the work was executed.

Signature  work-thread (work) => (thread)

Parameters

• work – An instance of <work>.

Values

• thread – An instance of <thread>.

work-wait Generic function

Wait for a work item to reach the given state. Valid states are $work-started and $work-finished.

Signature  work-wait (work state) => ()

Parameters

• work – An instance of <locked-work>.
• state – An instance of <work-state>. One of $work-started or $work-finished.

$work-started Constant

Used with work-wait to indicate that you want to wait until work has started executing.

Type <work-state>

See also: $work-finished

$work-finished Constant

Used with work-wait to indicate that you want to wait until work has finished executing.

Type <work-state>

See also: $work-finished
